

For shots 9 & 10, adding [0.137 0.089 0.138 0 0.020] to the shot arrival times for [Ross TMX DJStew Podium Cruiser] produced convergence on the South Barn location:

However, the same adjustment, applied to shot 9, does not provide a clear solution:

And here is the tweaked location of shots 9 and 10 overlaid on the map:

To be clear, I cannot think of any logical justification for why this particular adjustment would be appropriate. It was just a thought exercise. Having to add delays to all four of the sound recorders in the vicinity of the AGR building would imply that they all recorded sonic cracks vs. rifle reports. Assuming that shot 10 hit crooks, how could Ross have recorded a supersonic crack? If the bullet had stopped at the crooks position, then the sonic cone would not have reached the Ross recorder. Could shot 10 have passed through crooks and still been supersonic afterwards? That seems doubtful.
